lachance@uwo.ca

EXPLORATION OF YEAST
BIODIVERSITY REQUIRES A
SOUND SPECIES CONCEPT

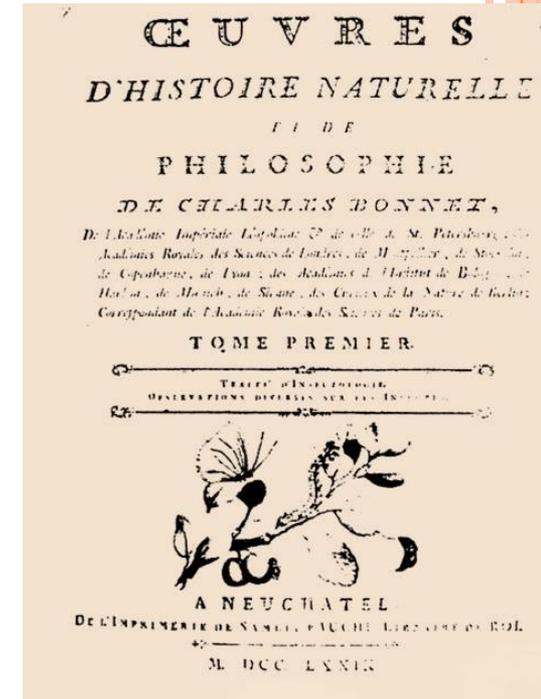

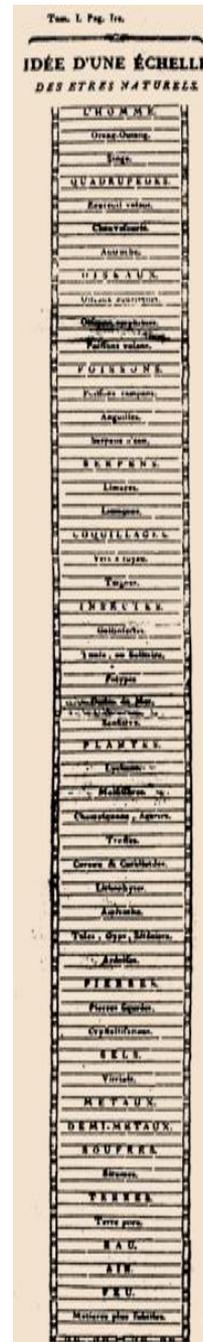

*Classis et ordo est
sapientiae,
species naturae opus*

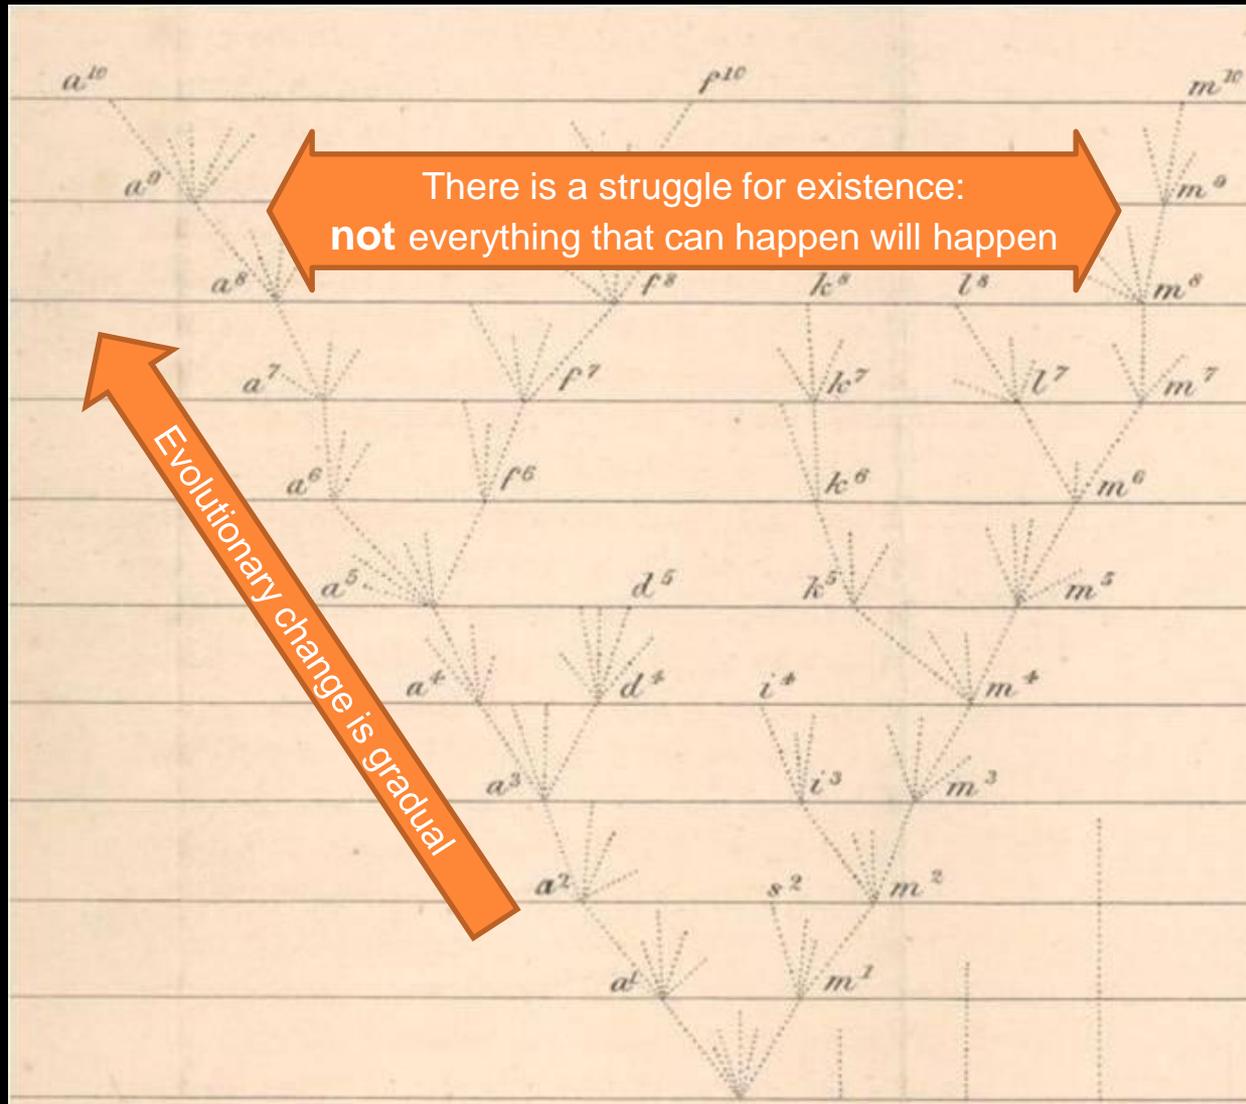

*Classe e ordem são
o trabalho da ciência,
a espécie o da
natureza*

METAPHYSICS OF SPECIES

- Principle of plenitude (Aristotle)
 - Everything that can happen will happen
 - The tree of life will fill up with every possible clade
- Principle of continuity (Aristotle, Linnaeus, Leibnitz, Newton, Lamarck, Darwin)
 - Natura non facit saltum
 - Evolutionary change is gradual

ENTERS DARWIN

SPECIES CONCEPTS

× Biological Species Concept

+ “Groups of interbreeding natural populations that are reproductively isolated from other such groups” (Mayr)

× Unit of evolution

× An intrinsic property of the members (objective)

× Testable/Falsifiable (*sensu* Popper)

× Limited to heterothallic, sexual species

SPECIES CONCEPTS

○ Genetic Species Concept

- “Groups of individuals that share a high amount of genetic similarity and are distinct from other such groups”
 - Microbiological version uses DNA/DNA reassociation
 - 80% for yeasts
 - Calibrated on the Biological Species Concept (proxy)

○ Broadly applicable

○ Not always testable (arbitrary)

○ Onerous... sequencing is a lot easier!

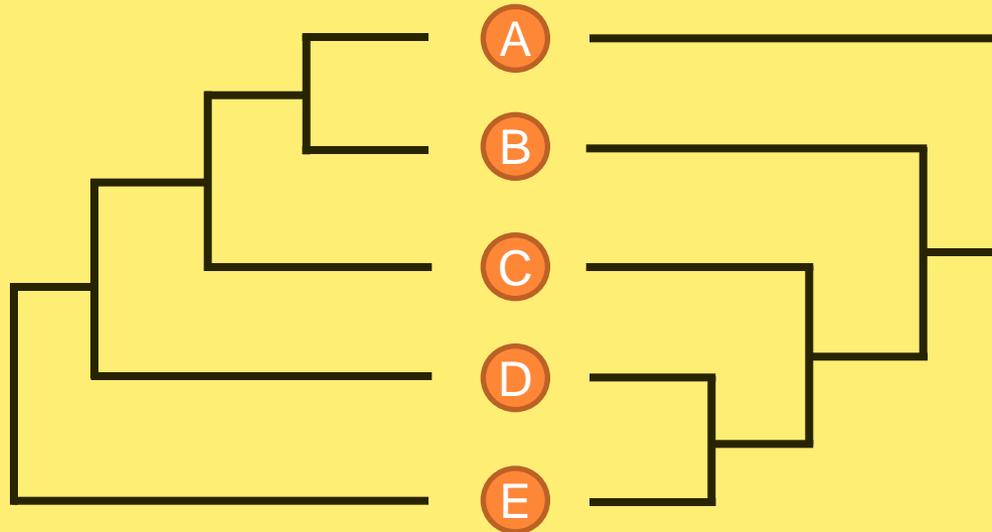

SPECIES CONCEPTS

- Phylogenetic Species Concept
 - “The least inclusive monophyletic assemblage that can be recognized from a unique set of characteristics”
 - Can be based on DNA sequence analyses
 - Reflects the history of the members (objective)
 - Rarely testable (*sensu* Popper)
 - Inclusivity difficult to define

EPISTEMOLOGY: PHYLOGENETIC CONCEPT

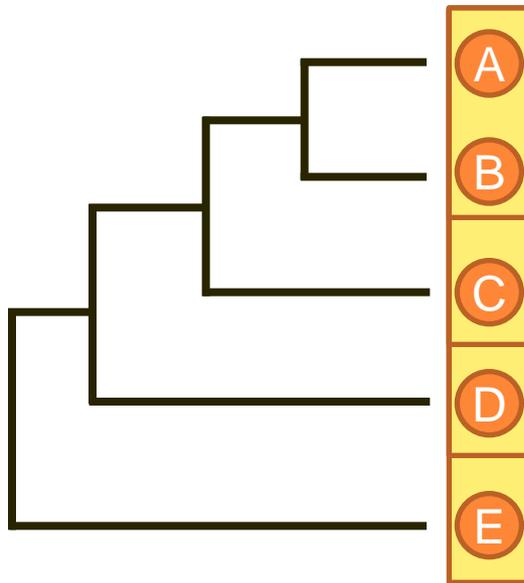

1. A tree is always an inference

Which is the correct tree?

EPISTEMOLOGY: PHYLOGENETIC CONCEPT

2. Assuming that this is the correct tree, which is the least inclusive assemblage?

The amount of differences considered necessary to give to any two forms the rank of species cannot be defined.

Darwin 1859

SPECIES CONCEPTS

× *Sequence Divergence* Species Concept

+ “Groups of individuals that differ by 3 or fewer substitutions in the D1/D2 LSU rRNA gene and differ from other such groups by 1% or more divergence

× Can be based on DNA sequence analyses

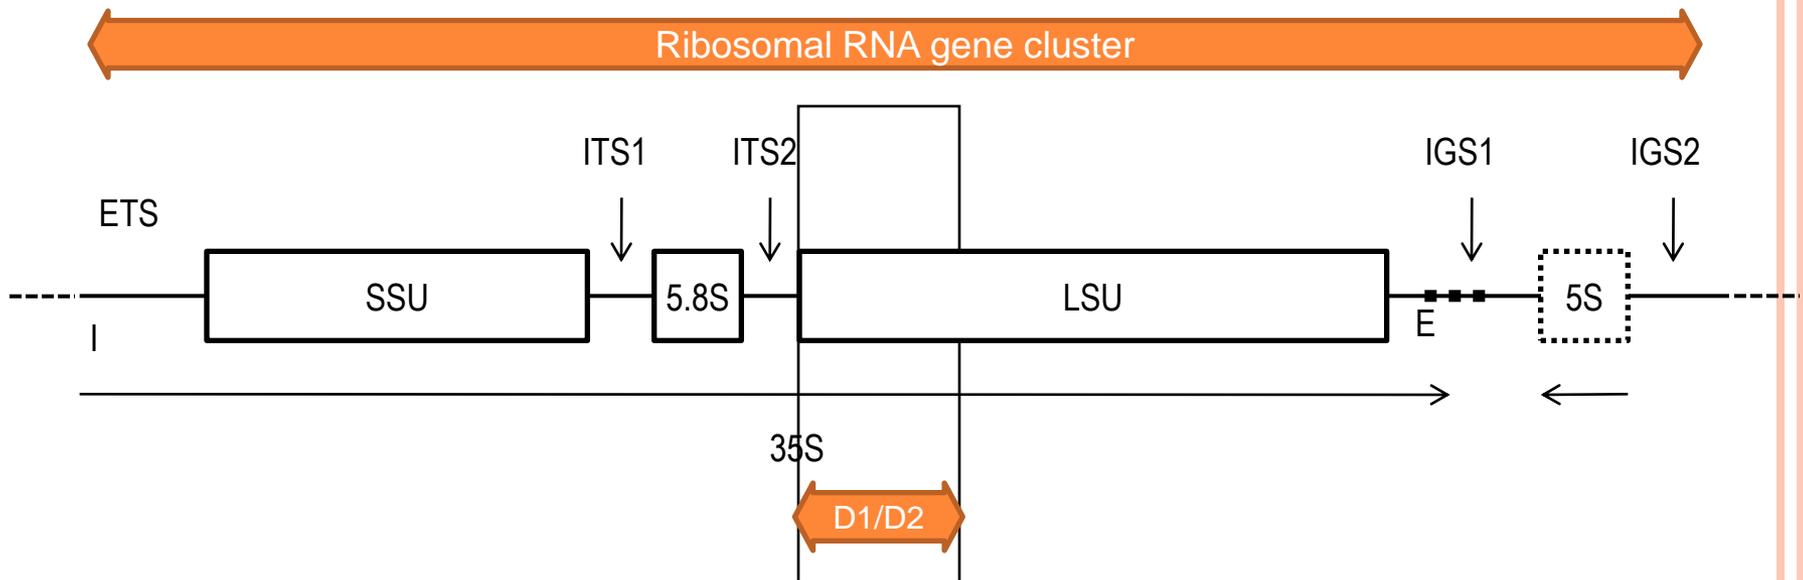

× Broadly applicable

× Some notorious exceptions

× Not always testable (arbitrary)

YEAST BARCODING SEQUENCE

SPECIES CONCEPTS

× *Sequence Divergence* Species Concept

+ “Groups of individuals that differ by 3 or fewer substitutions in the D1/D2 LSU rRNA gene and differ from other such groups by 1% or more divergence

× Can be based on DNA sequence analyses

× Broadly applicable

* Some notorious exceptions

× Not always testable (arbitrary)

SEQUENCE DIVERGENCE CONCEPT - EXCEPTIONS

- *Metschnikowia agaves*

- Holotype and allotype differ by 5 substitutions
 - Kurtzman & Robnett 1998

- *Clavispora lusitaniae*

- Holotype *et al* differ by > 30 substitutions from allotype *et al*
- Some strains contain both D2 variants
 - Lachance et al. 2003

SPECIES CONCEPTS

× *Sequence Divergence* Species Concept

+ “Groups of individuals that differ by 3 or fewer substitutions in the D1/D2 LSU rRNA gene and differ from other such groups by 1% or more divergence

× Can be based on DNA sequence analyses

× Broadly applicable

* Some notorious exceptions

× Not always testable (arbitrary) ←

SEQUENCE DIVERGENCE CONCEPT - EPISTEMOLOGY

○ Induction

- “Taking into account the variation seen in the preceding comparisons, it is **predicted** that strains showing greater than 1% substitutions in the ca. 600-nucleotide D1/D2 domain **are likely to be different species** and that strains with 0–3 nucleotide differences are either conspecific or sister species.” (Kurtzman and Robnett 1998)

○ Generalization

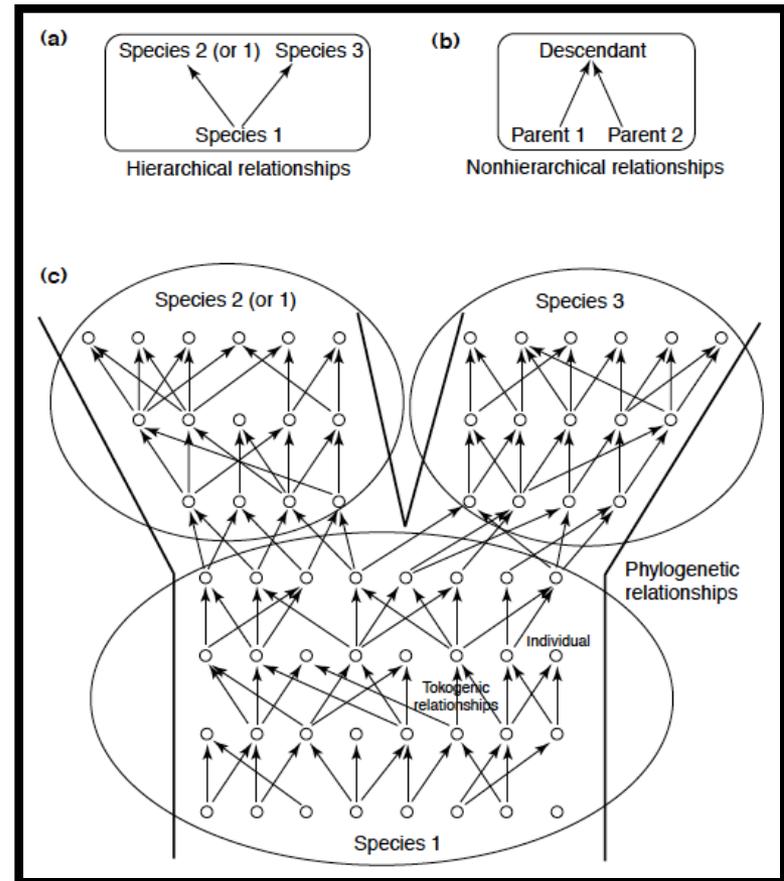

- “Kurtzman and Robnett (1998) **demonstrated** for ascomycetous yeasts that strains differing by more than 1% substitutions in the D1/D2 domain **represent separate species.**” (Kurtzman and Droby 2001)

TOKOGENY VS PHYLOGENY

“The only distinction between species and well-marked **varieties** is, that the latter **are** known, or believed, to be **connected at the present day** by intermediate gradations, whereas **species were formerly thus connected.**”

Darwin 1859

Posada & Crandall 2001

ex Hennig 1966

Posada & Crandall 2001

ex Hennig 1966

TOKOGENY VS PHYLOGENY

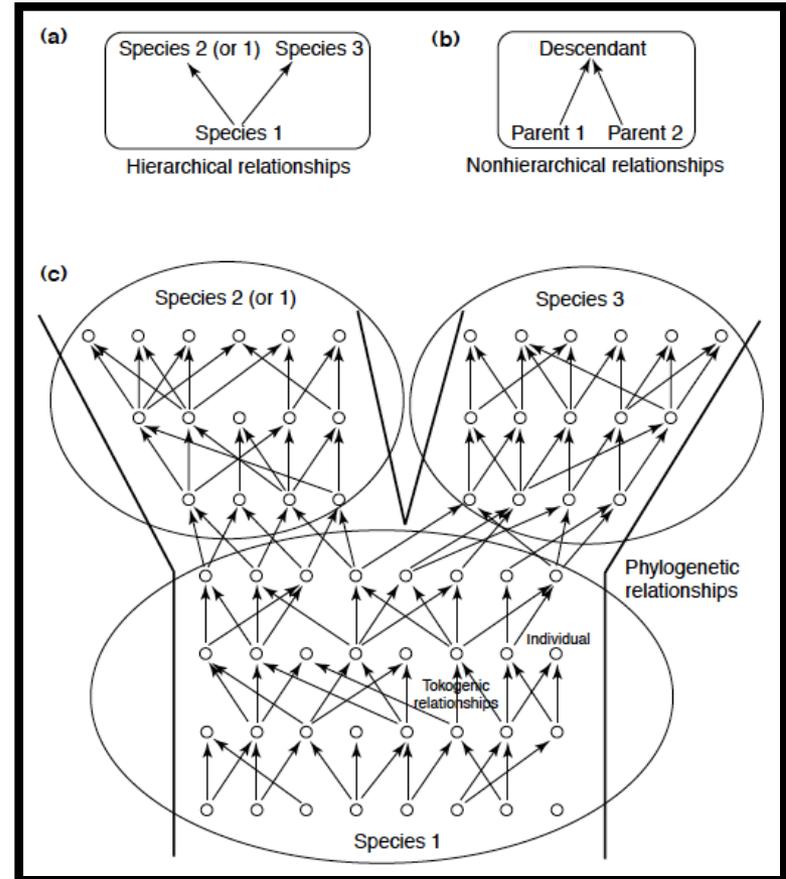

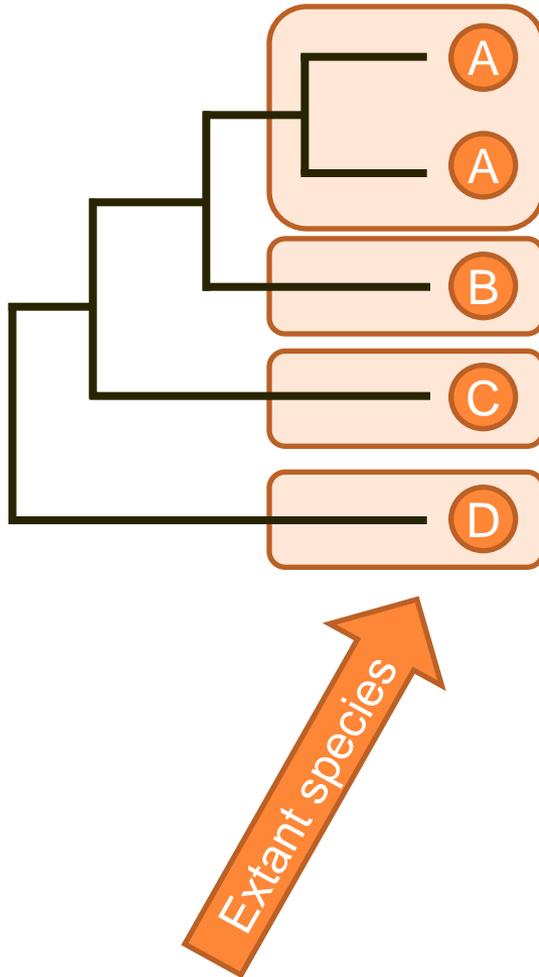

- ✗ Sequence relationships *between* species are phylogenetic, hierarchical, *i.e.*, **tree-like**
- ✗ Sequence relationships *within* species are tokogenetic, nonhierarchical, *i.e.*, **network-like**

Posada & Crandall 2001

ex Hennig 1966

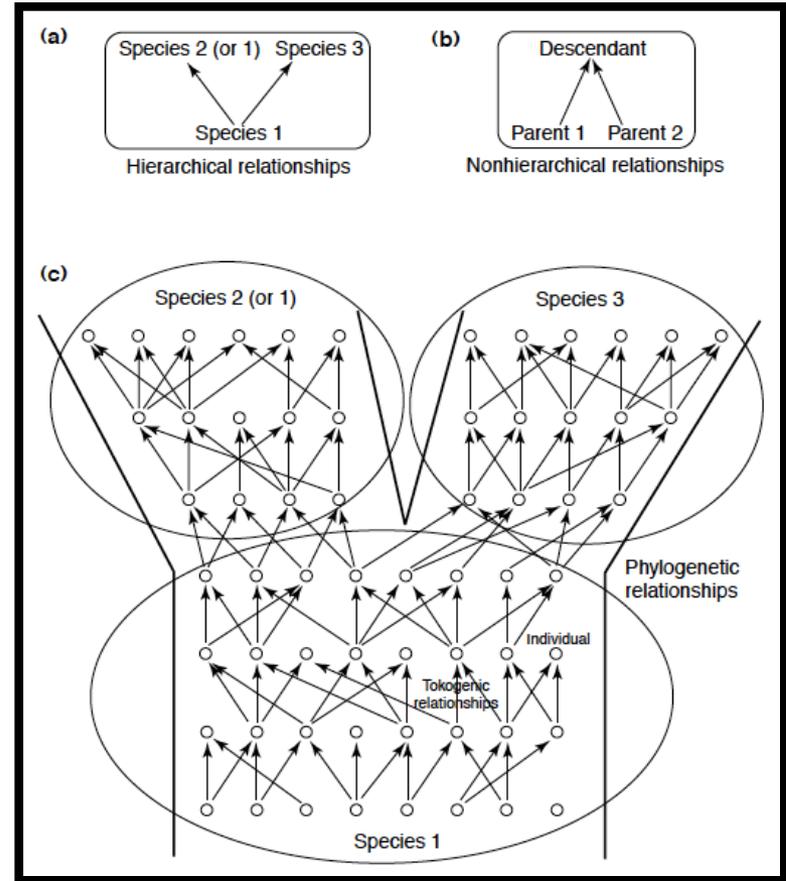

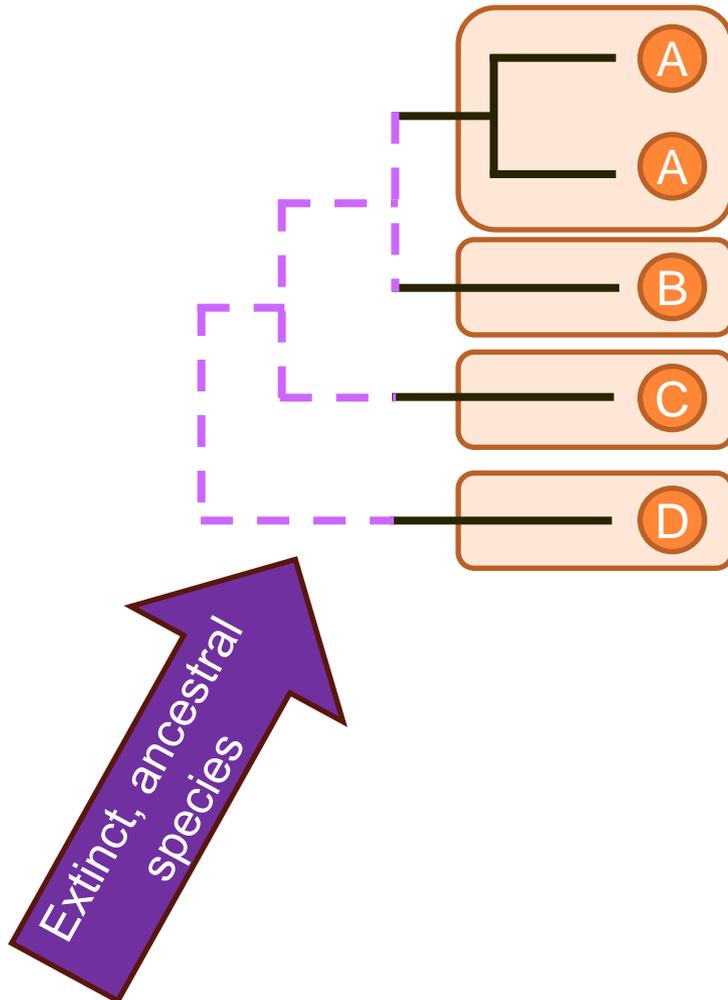

TOKOGENY VS PHYLOGENY

Posada & Crandall 2001

ex Hennig 1966

TOKOGENY VS PHYLOGENY

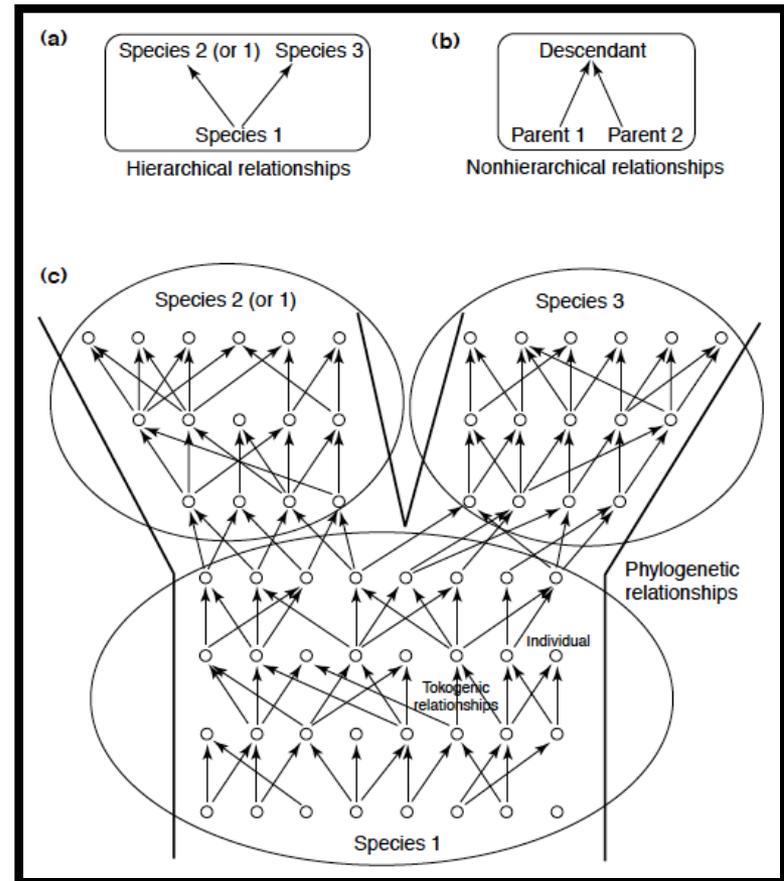

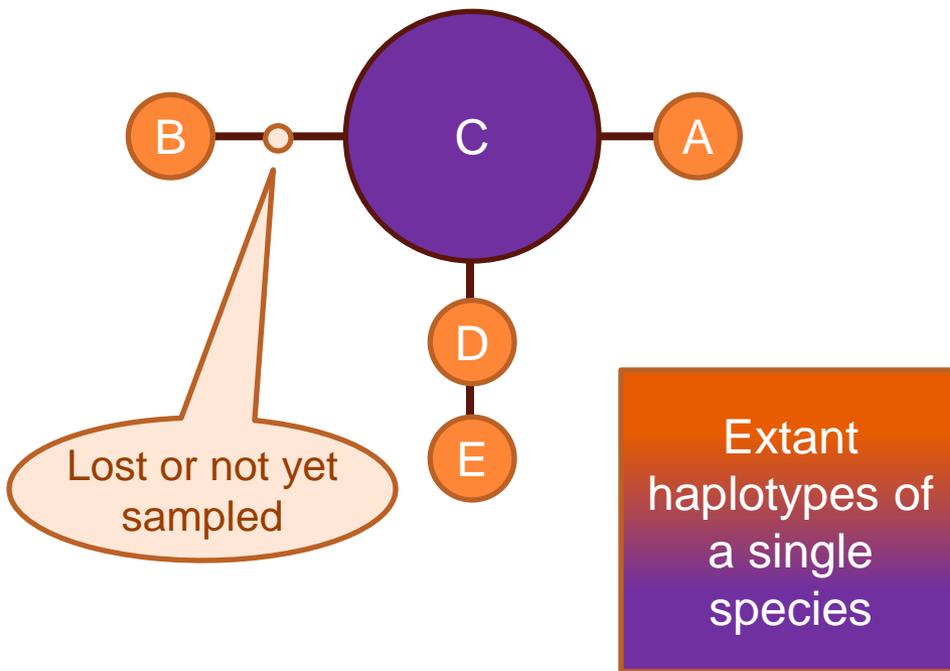

Ancestral sequences no longer exist!

Posada & Crandall 2001

ex Hennig 1966

TOKOGENY VS PHYLOGENY

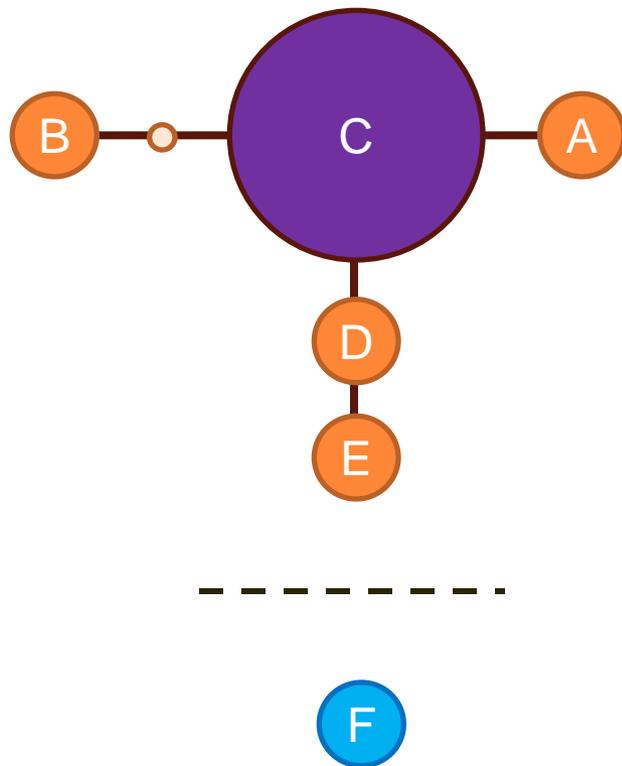

The ancestral sequence is the most abundant!

Posada & Crandall 2001

ex Hennig 1966

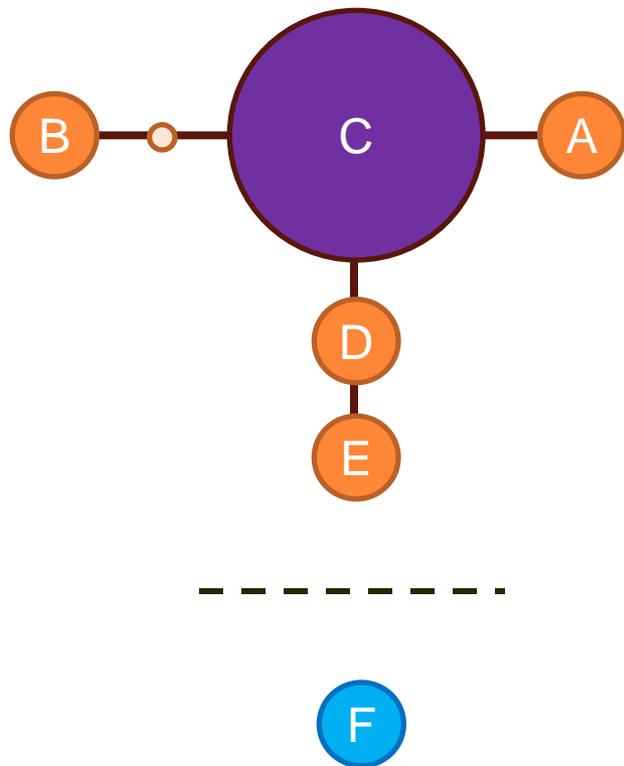

TOKOGENY VS PHYLOGENY

The program **TCS** is an implementation of **T**empleton, **C**randall, and **S**ing's (1992) haplotype network analysis with a statistical parsimony test for membership

Sequences are accepted in a network if the probability that each step represents a single substitution is greater than a specified P (0.95)

SUMMARY

- Barcode DNA sequencing
 - has become the standard for yeast identification
 - provides preliminary phylogenetic information
- Application to species delineation must be rooted in a sound theoretical framework
 - Adequate sampling of species is essential
 - ITS/5.8S-D1/D2 haplotype networks help in discriminating between tokogenetic (within-species) and phylogenetic (between species) relationships
